It is important to note that the items on this list are cryptographic *modules* . A module may *either* be an embedded component of a product or application, or a complete product in-and-of-itself. If the cryptographic module is a component of a larger product or application, one should contact the product or application vendor in order to determine what products utilize an embedded validated cryptographic module.

There is inevitably a larger number of security products available which use a validated cryptographic module, than the number of modules which are found in this list. In addition, it is possible that other vendors, who are not found in this list, might incorporate a validated cryptographic module from this list into their own products.
